EZ **EZ MANAGE** CURRENT SPRINT

# Now: ClickUp-grade tasks, a live AI dashboard, and two integrations

HR, Payroll and the Leave system are parked. This sprint focuses on the product core — make task management match **ClickUp** (not Monday), finish the AI control tower, and wire in three integrations: **Hubstaff**, **1Password** and **Whisper**. Only the work left to build is listed below.

PARKED — LATER HR / HRMS · Payroll · Leave System · Attendance

01

## Complete the ClickUp Task System

BIGGEST

Monday-style base → full ClickUp parity

> **Goal:** Upgrade the existing boards into a **ClickUp-grade** system — richer hierarchy, every view, dependencies, My Work inbox and goals. Add the ClickUp features the current app is missing.

✓ Core already built — boards, tasks, chat, @mentions, all current views, recurring, forms. **Not counted in this ETA.**

CLICKUP FEATURES TO BUILD

Space → Folder → List hierarchy NEW · List view (grouped) NEW · Timeline & Workload views NEW

Task dependencies (blocking / waiting) NEW
Priorities (Urgent / High / Normal / Low) NEW
Checklists & nested subtasks NEW
Multiple assignees NEW
Custom statuses per list NEW
Tags & task linking NEW
My Work / Home inbox NEW
Goals / Targets (OKRs) NEW
Native time tracking + estimates NEW
Reminders & Notepad NEW
Automations (no-code rules) NEW
Docs & Whiteboards NEW

M1 **Done when:** a user works in Space → List → Task with dependencies, sees everything in **My Work**, switches across all views, and the app feels like ClickUp.

02

## Complete the AI Dashboard

DEPENDS ON: 01

CEO control tower — live tiles + AI copilot

> **Goal:** Finish the executive control tower that reads everything from the task system — live metrics, an attention radar, and an AI copilot that answers questions from real data.

✓ CEO suite already built — tiles, team views, analysis chart, AI briefing, dark mode. **Not counted in this ETA.**

TO BUILD

Attention radar (mentions + approvals + overdue) NEW
Live pulse ticker (real-time) NEW
AI copilot — ask questions over live data NEW
Drill-down tiles → board / task NEW
Saved views & scheduled reports NEW

M2 **Done when:** real tiles update live, the attention radar surfaces what needs action, and the AI copilot answers "what's at risk this week?" from live data.

03

## Hubstaff Integration

NEEDS: API KEY

Real time-tracking, activity & screenshots

> **Goal:** Connect Hubstaff so tracked time, activity levels and screenshots flow into tasks and the dashboard automatically — no manual timers.

BUILD

- OAuth / API connect NEW
- Sync time entries → tasks NEW
- Activity % + idle time NEW
- Screenshots + apps / URLs NEW
- Map Hubstaff projects/members → boards/users NEW
- Team productivity on CEO dashboard NEW
- Webhooks (real-time) NEW

M3 **Done when:** a task shows real tracked time + activity from Hubstaff, and the dashboard shows live team productivity. **(You provide the Hubstaff API key.)**

04

## 1Password Integration

NEEDS: 1PASSWORD ACCOUNT

Secure credential vaults for the agency

> **Goal:** The agency holds credentials for 20 companies (hosting, social, client tools, API keys). Give the team **secure shared vaults** — scoped by role, with an audit trail — instead of passwords in chat.

BUILD

- Team vaults (per company / client / project) NEW
- Logins · API keys · secure notes NEW
- Role-based vault access NEW
- 1Password Connect sync (or native encrypted vaults) NEW
- Copy / reveal with permission NEW
- Access audit log NEW

M4 **Done when:** a team member opens a client's vault, copies a credential they're allowed to see, and the access is logged — nothing shared in chat. **(You provide the 1Password account / Connect token.)**

05

## Whisper AI

NEEDS: API KEY

Voice notes → searchable text

> **Goal:** Record voice notes on tasks and comments, and auto-transcribe them with Whisper so everything is readable and searchable.

BUILD

- Voice notes on tasks / comments NEW
- Auto-transcribe (Whisper API) NEW
- Searchable transcripts NEW
- Multi-language support NEW
- Voice → task (optional) NEW

M5 **Done when:** a voice note is transcribed to text under the audio, and the text is searchable. **(You provide the Whisper / OpenAI API key.)**

**Build order:** 01 → 02 first (core product + control tower), then 03 · 04 · 05 (integrations, which slot onto tasks). Voice notes are built in 01 and transcribed in 05 — so they connect.
