EzManage 2.0

Developer Product Requirements Document | Version 1.0 | 21 October 2026

Vision: Upgrade the existing EzManage task management platform into a multi-company business operating system combining advanced project management, HRMS, attendance, payroll, workflow automation, recruitment, CRM, expenses and executive analytics.

1. Existing baseline - preserve and extend

The supplied EzManage SOP v1.0 documents Workspaces > Boards > Tasks, groups, configurable columns, private/public boards, table/Kanban/calendar/chart views, forms, comments, file attachments, subtasks, time logs, Excel import/export, and workspace/board permissions. Treat these as existing documented capabilities, subject to a codebase audit. Do not assume features below are already implemented.

2. Core product architecture

• Multi-company hierarchy: Organization / Company / Department / Space / Folder / Project / Task / Subtask. Separate data by company, with explicitly authorized consolidated reporting.

• Role-based and attribute/field-level access for tasks, HR, salary, bank details, expenses and payroll. Restrict sensitive HR/payroll even from generic platform administrators unless explicitly authorized.

• API-first modular services, shared identity, employee master records, events/notifications, configurable forms, reusable workflows, searchable audit logs, file storage, imports and exports.

• Responsive web application first; mobile employee self-service and attendance workflows. Localization, time zones, currencies, and country-specific payroll adapters.

3. Advanced project management - Monday.com / ClickUp inspired

• Task dependencies, milestones, critical path, recurring tasks, templates, priorities, tags, custom fields and bulk actions.

• Views: existing table, Kanban, calendar and chart plus Gantt, timeline, workload, list, portfolio and cross-project dashboard.

• My Work inbox, mentions, comments, approvals, notifications, workload capacity, time estimates vs actual time, goals/OKRs and project status reports.

• Project intake forms, configurable statuses, automation rules, saved filters, permissions, document links, dashboards and exportable reports.

4. HRMS and employee lifecycle

• Employee profile: employee ID, company, department, reporting line, job title, employment status, work location, start/end dates, pay classification, contacts and emergency contacts.

• Recruit-to-hire onboarding, checklists, employment contracts, signed policy acknowledgment, document expiration reminders, probation, transfers, promotions and offboarding.

• Employee portal for permitted personal updates, leave requests, timesheets, payslips, training, assigned assets and requests.

• Confidential HR cases, performance reviews, goals, manager feedback, disciplinary actions, training, certificates and role-based retention policies.

5. Attendance, shifts and leave

• Clock-in/out via mobile/web/kiosk, configurable GPS/geofencing with consent/privacy controls, break capture, missed punch correction and audit history.

• Shift rosters, rotating schedules, open shifts, swaps, overtime alerts, site/client/project allocation and scheduling conflicts.

• Vacation/sick/other leave categories, balances and accrual rules, holiday calendars, request/approval workflows and calendar integration.

• Employee submission > supervisor approval > locked payroll-ready timesheet, with corrections through controlled adjustment workflow.

6. Payroll and compensation - Canadian first

• Support hourly/salary workers, weekly/biweekly/semi-monthly/monthly cycles, regular/overtime/statutory holiday earnings, commissions, bonuses, allowances, deductions and vacation pay.

• Payroll run workflow: draft > validate > reviewer > authorized approver > locked > bank/provider transmission > reconciliation. Separation of duties and immutable change history.

• Employee pay statements, payroll register, employer cost reporting, remittance reporting, T4/ROE workflows and province-specific rules including Quebec if required.

• Prefer integration with a compliant Canadian payroll engine/provider in phase 1. Have payroll experts validate federal/provincial tax, CPP/QPP, EI, statutory holidays, employment standards and year-end processing.

• No direct bank payout without explicit dual authorization, positive confirmation, payment controls and exception reporting.

7. Workflow automation and approvals

• No-code builder: WHEN trigger + IF conditions + THEN actions; supports schedules, branching, delays, approvals, reminders, escalations and webhooks.

• Examples: overdue task -> manager escalation; approved leave -> calendar and balance update; approved timesheet -> payroll; new hire -> onboarding tasks; expense -> budget check -> approvals.

• Versioned workflow definitions, run history, retries, failure alerts, idempotency and permissions to publish automation changes.

8. Recruitment, CRM, finance and documents

• ATS: job requisitions, applicant stages, resume parsing/search, interview scheduling, scorecards, offers, onboarding and recruiter KPIs.

• CRM: leads, contacts, accounts, pipeline, activities, proposals, reminders, follow-ups, conversion reporting and role-based visibility.

• Expenses: claims, receipts, category/budget coding, departmental review, budget validation, final authorization, payment preparation, payment authorization and independent reconciliation. Prevent self-approval.

• Document management: SOPs, templates, version control, searchable knowledge base, access restrictions, e-signature integration and acknowledgment tracking.

9. Multi-business configurable modules

Business	Optional specialized workflow
Security	Guard shifts, site coverage, licenses, incidents, client timesheets

Business	Optional specialized workflow
Staffing	Candidate compliance, placements, client shifts, recruiter scorecards
Ecommerce	ASIN/product launch tasks, sourcing, purchasing, vendor follow-ups
Logistics	Driver records, fleet maintenance, dispatch tasks, vehicle expenses
Corporate	Shared HR, finance requests, CRM, project and executive reporting

10. Executive dashboards and reporting

• Company selector and cross-company executive view; employee count, attendance, payroll expense, open/overdue tasks, project progress, approval queues, pipeline, team productivity and exception alerts.

• Drill-down by department, location, manager, project and period. Permission-aware exports, scheduled reports, chart widgets and KPI definitions.

11. Security, quality and operations requirements

• MFA, SSO-ready identity, encryption in transit/at rest, secure secrets, least privilege, tenant isolation, secure file handling, backup and restore testing.

• Detailed audit logs for financial, payroll, HR and permission changes; retention, privacy controls and deletion workflows aligned with applicable law.

• Automated unit/integration/end-to-end tests, staging environment, CI/CD, monitoring, incident response, performance/load testing and disaster recovery plan.

• Document API contracts, data migration strategy, feature flags, user acceptance tests and rollback plans.

12. Proposed delivery sequence (estimates, not commitments)

Phase	Scope	Indicative duration
1	Task upgrades, permissions, automations, dashboards, employee records	8-12 weeks
2	Attendance, scheduling, leave, timesheet approvals, payroll integration	10-16 weeks
3	ATS, CRM, expenses, performance, documents, industry modules	10-16 weeks
4	Advanced AI, forecasting, mobile enhancements, integrations	Ongoing

Timeline depends on current code quality, integrations, compliance scope, team size and acceptance criteria. A discovery sprint must precede a fixed-price commitment.

13. Required developer deliverables

• Current codebase audit and feature gap matrix: existing / partial / missing / replace / integrate.

• Detailed backlog of user stories with priority, dependencies, story points, acceptance criteria and named owners.

• Architecture diagrams, database/entity model, tenant isolation model, payroll integration approach and security threat assessment.

• Clickable UX prototypes for executive dashboard, task board, employee profile, leave request, shift roster, payroll review and approval queues.

• Phase-by-phase cost and staffing estimates, milestones, demo schedule, testing strategy, migration plan, documentation and maintenance SLA.

14. Sample acceptance criteria

• A manager cannot view salaries of employees outside their authorized scope; access is tested at API and UI levels.

• A finalized payroll run cannot be silently edited; any correction creates a traceable adjustment and reapproval.

• An approved timesheet transfers correct employee, company, hours, pay code and period to payroll without duplication.

• A task dependency blocks or warns on premature completion according to project configuration.

• A user assigned to Company A cannot retrieve Company B data by changing an API identifier.

• An expense cannot be submitted and finally approved by the same person where separation of duties is required.

15. Open decisions for product owner

• Internal-only software or future commercial SaaS? Design multi-tenant architecture now if external customers are expected.

• Initial payroll jurisdiction: Ontario only, all Canadian provinces, Quebec, USA or multiple countries?

• Payroll strategy: provider integration versus in-house tax engine; banking/payment provider selection.

• Which existing EzManage components are production-ready? What stack, hosting, team and data volumes exist?

• Which business-specific modules are required for first launch?

Source note: Baseline existing capabilities are drawn from the supplied EzManage SOP v1.0 (16 pages). All proposed features, architecture, sequencing and acceptance criteria are new recommendations and require developer validation.
